

MUNICIPAL INFRASTRUCTURE

Engineering and Construction Management

Riverside Development and Minnesota Street Sanitary Sewer Improvements

Client: Town of Collingwood

Location: Town of Collingwood, Ontario

The Greenland Group was initially retained in 2004 to provide engineering support for a Draft Plan of Subdivision in the south east end of Collingwood. The proposed development consisted of 2.0 km of internal subdivision roads and approximately 450 residential units. Greenland provided engineering design and contract administration/inspection services for all underground and surface works for the proposed development.

In co-operation with the Town of Collingwood, Greenland also developed external sanitary drainage solutions for the proposed subdivision to mitigate existing sanitary drainage capacity problems within the Town as well as solutions to external traffic problems (intersection improvements). Greenland was subsequently retained to design and administer the construction of approximately 1 km of sanitary sewer improvements and road restoration works and two (2) key intersections on existing streets in the Town of Collingwood. The external sanitary and road restoration works were complete for approximately \$1M in 2007.
